The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 16-17, 20, 2232 are rejected under 35 U.S.C. 103(a) as being unpatentable over Deffense and Tirtiaux taken together.

Deffense discloses multiple fractionations of oils. In Figure 1 the fractionation of palm oil is shown. Here palm oil is fractionated into hard stearin and olein. Then olein is fractionated into soft palm mid fraction and super olein, in a second stage fractionation. Then the palm oil is further fractionated into a third stage. On page 36, palm mid-fraction is said to be considerably enriched with SUS, which corresponds to applicants G2U. The claims appear to differ from Deffense in the recitation of how dry fractionation is performed. Tirtiaux specifically describes the fractionation process as "cooling melted fat" to create hard crystals for separation. The claims appear to differ from the references in the recitation of a heating step. Although heating is not mentioned, one of ordinary skill in the art would understand that a melting fat must have undergone a heating step. It would have been obvious to one of ordinary skill in the art to heat the

palm oil or palm fraction of the references to melt the oil fraction for crystallization. It is appreciated that the specific ratio of solid to liquid fractions of claims 23-26 are not mentioned but would of ordinary skill in the art would be expected to optimize this ratio according to the yield of fraction desired. It is appreciated that the fats in the reference are not hydrogenated or isomerized but one of ordinary skill in the art would appreciate that the claims are directed to a process. The fact that a fat is chemically altered in some way is not seen to materially impact a process that separates a fat according to its melting point.

The declaration filed in this application has been considered but is not sufficient to overcome the rejection. The declaration is not commensurate in scope with the claims.

The rejection of the claims over Harris in view of Keulemans has been withdrawn in response to applicants' amendment to the claims.
